

Instructions for Stat 218 Instructors

For each of the components of this experiment/active learning project, please complete the following procedure:

1. Download student responses from canvas as a CSV file.
2. Create a data frame containing the following columns:
 - Year
 - Semester
 - Section number
 - Student name or NUID
 - A unique ID code for each student. In R, you can generate this using the following code on the column containing the student's name or NUID:

```
library(digest)  
digest("name")
```

```
[1] "cacad79ae9bfbfa021fcbac8cda3dca6"
```

```
digest("NUID")
```

```
[1] "de649e940d76fea7ec2fb717faa467c0"
```

3. Merge this data frame with each of the CSV files obtained in step 1
4. Delete any columns containing the student's name or NUID
5. Write out each CSV file.

Please see Tyler Wiederich or Dr. Vanderplas if you need help with this operation.
